

TC IPA® Integrated Payment Application Simplifying payments and compliance

TC IPA®, Integrated Payment Application, allows payments to be securely collected and aggregated through a single consolidated, integrated, and resilient application.

This intelligent solution can communicate with an organization's system or systems integrating them across their businesses, locations, or departments, limiting duplication of efforts and keeping system payment information in balance.

In addition, TC IPA is integrated with popular electronic health record software (EHR), such as Epic.

Bringing Payments Together

Leveraging a secure API, TC IPA brings payments together by integrating native systems, third-party solutions, and more for comprehensive, centralized processing and reporting. Features include:

- » Ability to accept check or credit (credit card, debit, FSA/

HSA/HRA) and process partial payments

- » Supports IIAS transactions
- » Ability to push completed transactions to native systems to keep customer accounts up-to-date and systems in balance
- » Configurable, role-based security to manage locations and users
- » Robust administrative functionality
- » Asset management controls including device health monitoring and reporting.

Streamlining Compliance

With increasing incidents of data breaches, it is more important than ever to ensure payments are secure. Utilizing TC IPA, payment data is protected and the risk and expense of processing electronic payments are minimized.

TC IPA combined with Sphere proven solutions, helps reduce the cost and complexity of Payment Card Information (PCI) Data Security Standard (DSS) compliance and EMV. Payment card information is encrypted at point of entry whether through manual entry, swipe device, mobile device, or online.

- » Sensitive payment information will never be "in the clear"
- » Web transactions will direct post to our servers, PCI will not reside on client's system

Device Management

TC IPA supports a variety of devices, including NFC support, MICR reader and more.

Central Hub for Reporting

Sphere systems provide data back to applications for robust reporting and audit trail. Customer maintains control over transactional data to report and integrate into other systems as they see fit.

Log in anywhere, connect to anything (devices, systems, solutions), and accept payments with ease.
