

PayWithIt®

Secure mobile payments at your fingertips

PayWithIt® secure mobile payment acceptance solution is ideal for merchants who would like to accept credit cards, signature debit transactions, or ACH payments on the go.

Accept Payments Anywhere

Unique environments such as healthcare, catering, emergency rooms, transit, trade shows, and countless others, require flexible payment solutions that are untethered from the terminal. The feature-rich PayWithIt answers this need.

Fully customizable, you can set up PayWithIt to work best with your organization. Access the settings page to customize the application for users. For example, define a set of amounts to be displayed as drop-down options. Modify billing information fields. You can even create custom fields to collect data unique to your business.

To get started, simply download the application from your device's App Store. Users log in to the application using their TC Vault® credentials. Permissions by location or Customer ID (CustID) enabled in the TC Vault will apply to PayWithIt as well.

Protect Payments

When accepting remote payments, reconciling transactions, or reviewing reports, card holder data remains protected at all times with PayWithIt. Featuring an encrypting card swipe, PayWithIt encrypts card holder data at the swipe head before it enters the mobile device. Sensitive card data is turned into non-accessible data reducing vulnerability to skimming.

If your device is lost or stolen, don't worry. Full card holder data is not stored on the device. You can always rely on the web-based TC Vault as a central resource for your transaction history.

Features

- Optional encrypting card reader
